Case 2b

Improved Arduino Library for (e.g.) i2c sensors

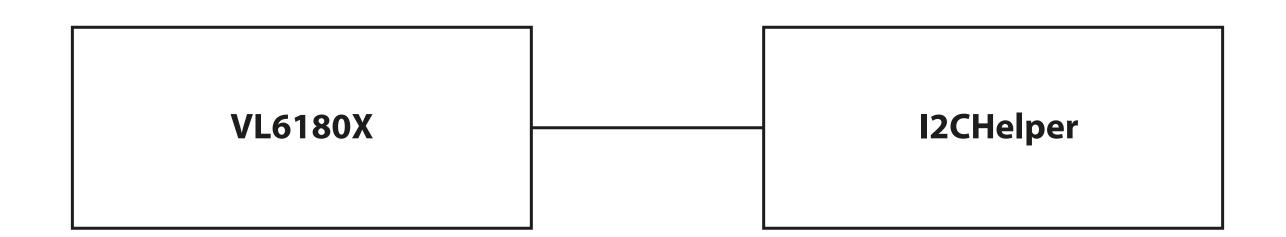

Improving Cohesion / Coupling

• Remember we had writeRegister8, writeRegister16 etc all over VL6180X.cpp

VL6180X

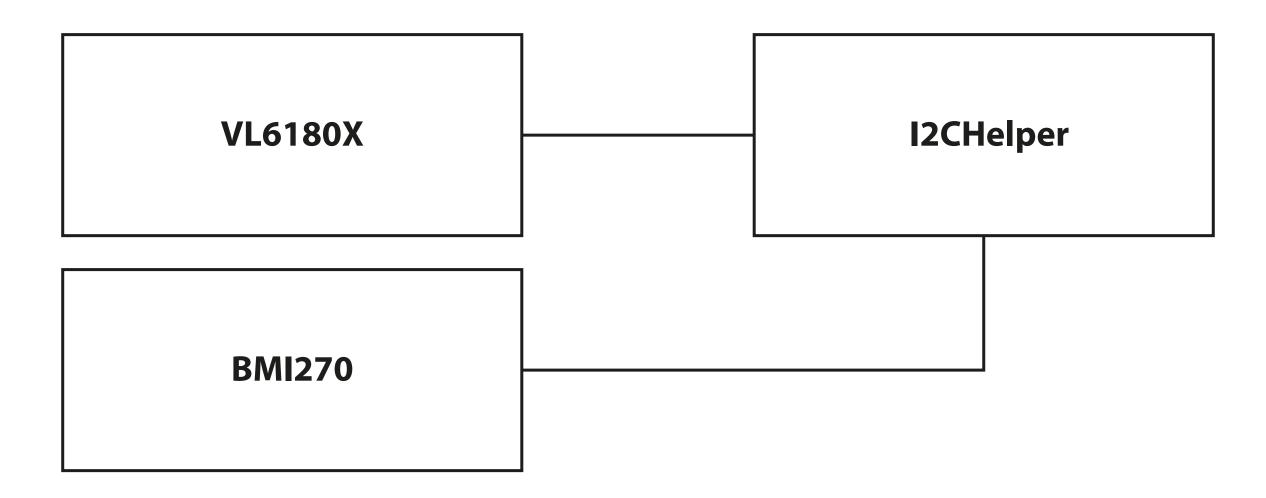

Improving Cohesion / Coupling

• Remember we had writeRegister8, writeRegister16 etc all over VL6180X.cpp

Improving Cohesion / Coupling

- Remember we had writeRegister8, writeRegister16 etc all over VL6180X.cpp
- How many instances of I2CHelper will we (ever) need?!

LLM (Gemini) cue

- Huge improvements:
 - Delegation of i2c stuff to I2CHelper
 - Design for change: your main can not create more than one instance of i2c

Note: refer to Prog5_Lab3_I2CSensorLib.md on how to use mermaid UML diagrams in markdown files.

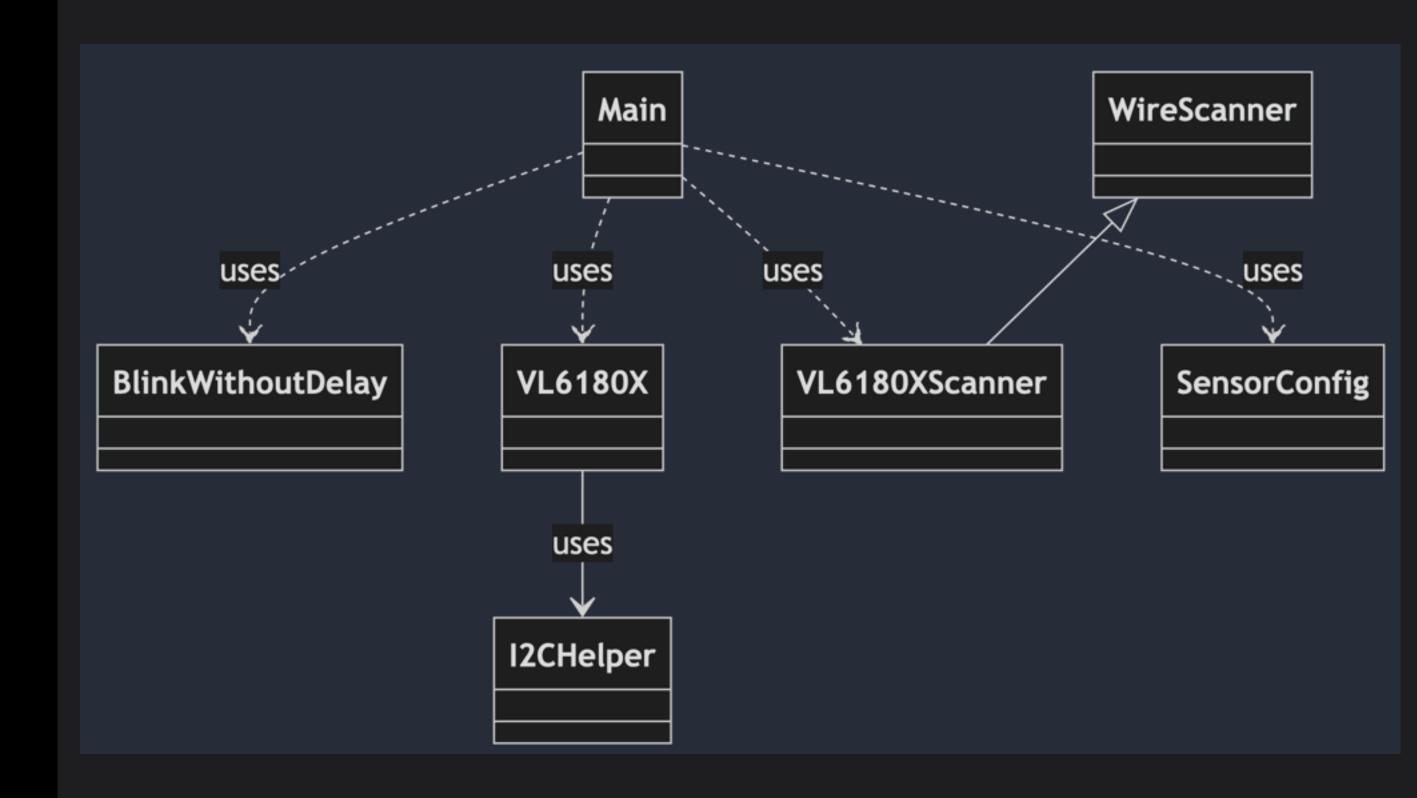

VL6180X -uint8_t _address -TwoWire* _i2c -I2CHelper _i2cHelper -static const uint16_t IDENTIFICATION__MODEL_ID -static const uint16_t SYSRANGE__START +VL6180X(uint8_t address = 0x29, TwoWire* wire = &Wire) +bool begin() +bool init() +bool configureDefault() +uint8_t readRangeSingle() +uint8_t readRangeContinuous() +uint8_t getModelId() +void startSingleRangeMeasurement() +bool isDataReady() +uint8_t getRange() +void clearInterrupt() -static const uint16_t ...(other register addresses) uses 12CHelper

- -TwoWire* _wire
- +I2CHelper(TwoWire* wire)
- +template T readRegister(uint8_t address, uint16_t reg)
- +template void writeRegister(uint8_t address, uint16_t reg, T value)

Class diagram

For now "Final" version:

 Note: this is a very concise class diagram, readability is great but virtually no details.

Class diagram

"Final" version:

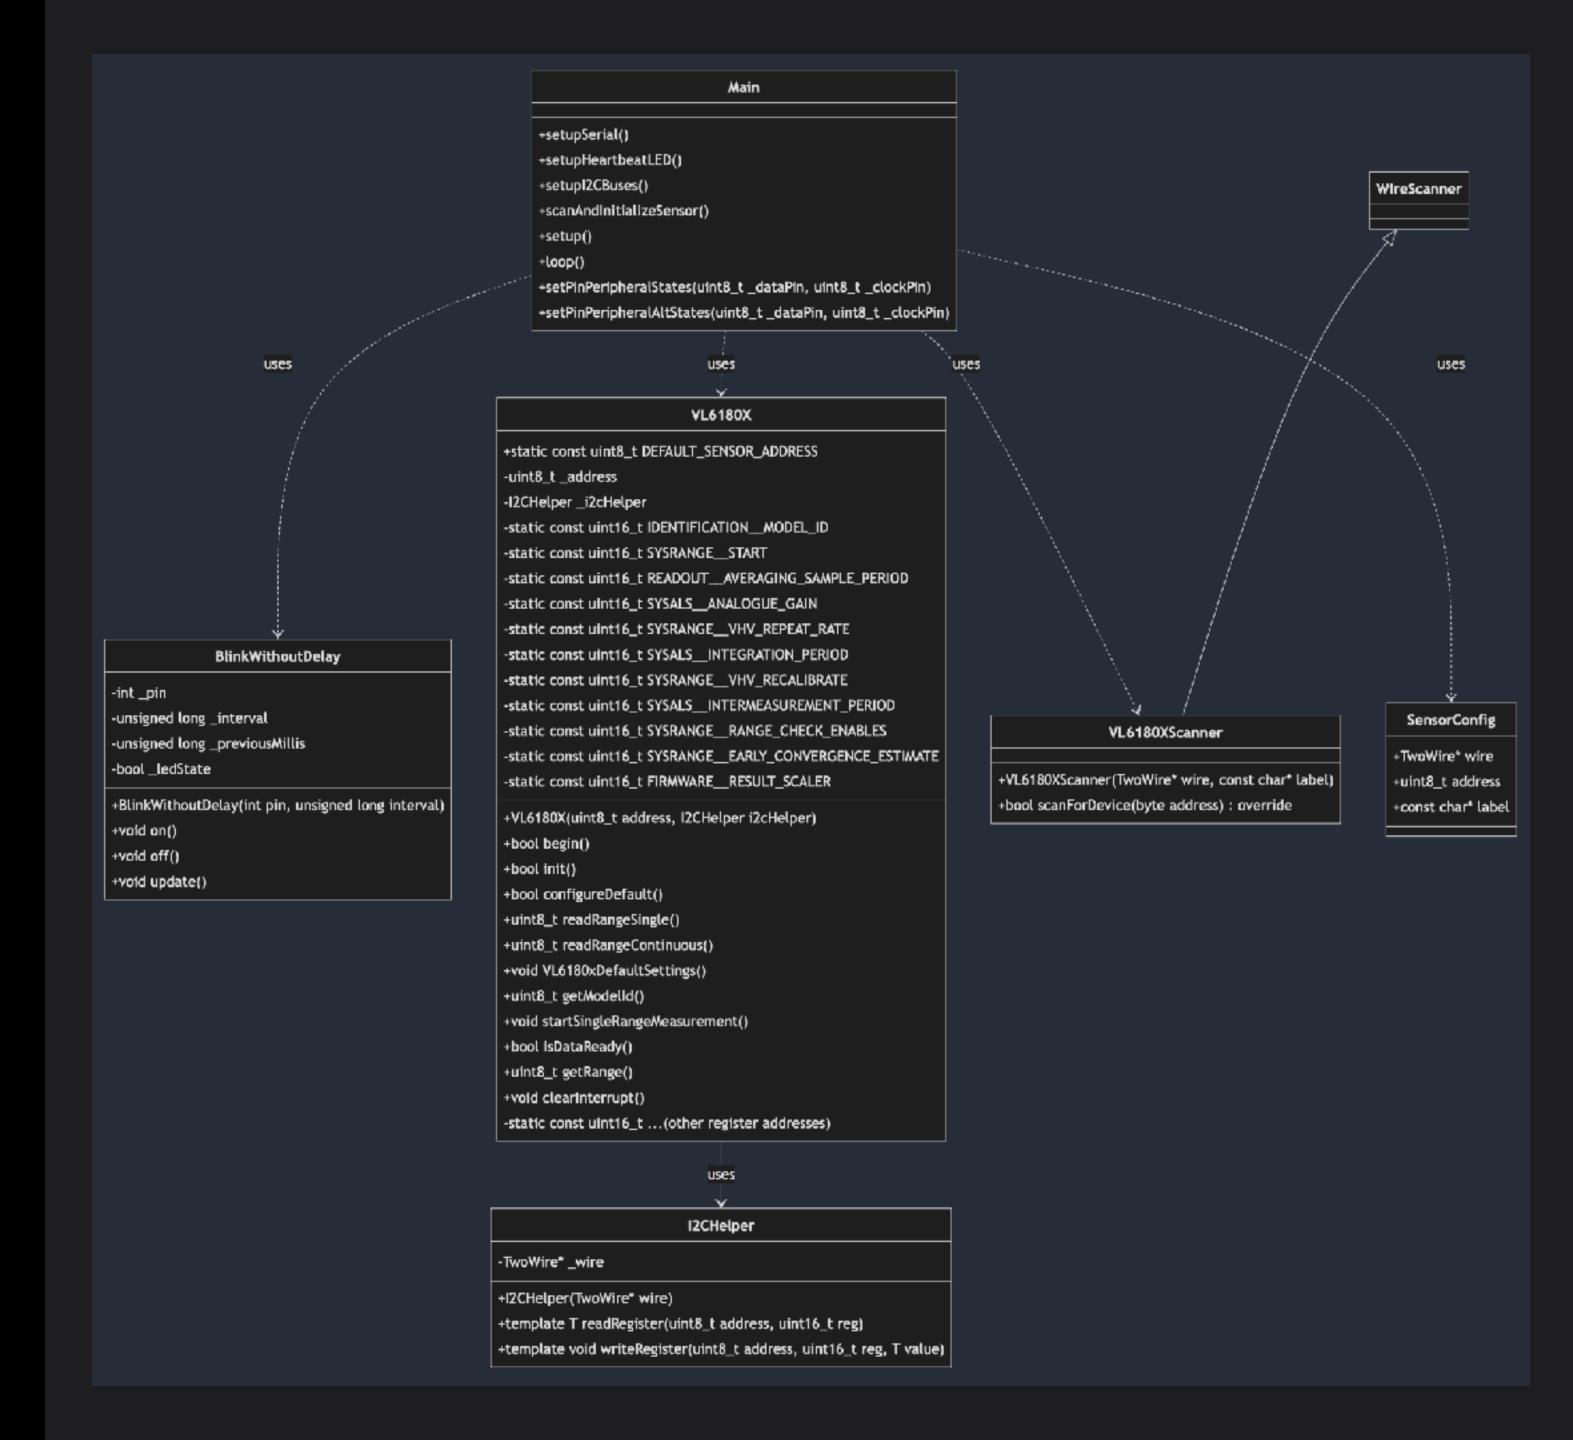

- Inheritance (is-a) vs Dependency (uses-a)
- Solid vs. Dotted Line
- The solid line in inheritance indicates a stronger, more direct relationship, as the child class inherits the parent's structure.
- The dotted line in dependency signifies a looser coupling, where one class simply uses another class's features.

Class diagram

"Final" version:

• Note: this is a very complete class diagram, but not very readable.

LLM (Gemini) - Key Points

Use them to learn, check and recheck the reasoning...

- Register Addresses: The register addresses are defined as constants at the beginning
 of the .cpp file for better readability and maintainability.
- init(): This function performs the mandatory register settings as per the datasheet.
- configureDefault(): This function sets up the recommended register settings. You can customize it further based on your application's requirements.
- readRangeSingle(): This function triggers a single range measurement and returns the result.
- readRangeContinuous(): This function starts continuous range measurements and returns the latest available result.
- **Helper Functions:** The readRegister, writeRegister, and writeRegister16Bit functions encapsulate the I2C communication for register access.

LLM (Gemini) - Remember

Some advice...

- Datasheet: Always refer to the VL6180X datasheet for the most accurate and up-to-date register information.
- Error Handling: Consider adding error handling to the register access functions and other critical parts of the library for robustness.
- Additional Features: Implement functions for other sensor features like ambient light sensing, proximity detection, and interrupt handling as needed.
- Optimization: You might need to optimize the code further for performance or power consumption, especially in resource-constrained embedded systems.

Note: we will refactor the entire project for week 7
